New nucleic acids encoding a ribonuclease (Rnase), useful for the precise targeting of Rnase to a predetermined cell receptor.
                                                                                                                                                                                          The present sequence represents a frog ribonuclease protein (ranpirnase) (RNase). The specification describes a synthetic ribonuclease protein, in which the addition of cysteine in the ribonuclease facilitates the chemical linking of a targeting molecule by the single reactive sulfhydryl group. The specification also describes a method for the production of ranpirnase using DNA technology instead of processing biological material. The re-engineering of the protein molecule allows easier attachment to a targeting molecule thereby making it possible for the ribonuclease to be delivered to a particular cell receptor where it might be most effective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Search completed: May 7, 2004, 21:38:28

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a recombinant Onc protein comprising a 104 amino acid sequence having Gln at position 1. Onc, a ribonuclease from Rana pipiens occytes, is known as an antitumour agent (e.g. for treating pancreatic cancer) and inhibitor of human immunodeficiency virus type-1 replication. It can be used therapeutically or as a cell-culture selection agent, e.g. to identify gene therapy compositions able to inhibit tumour growth
                                                                                                                                                                                                                                                                                                                                                                                                     Recombinant Onc protein with glutamine residue at position 1 - useful as antitumour and antiviral agent, also as cell culture selection agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   28

The present sequence is a recombinant Rana pipiens ribonuclease (RaPLR1) protein with Met23Leu. Carboxy terminal end of recombinant RaPLR1 has a dovalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytocoxic fusion proteins. They can be used for treatment of cancer and autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                28
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 26

```
The present sequence is a recombinant Rana pipiens ribonuclease protein (RaPLR1) with Met at position 1 attached to (His)6 tag and Met24Leu. Carboxy terminal end of recombinant RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties form expression proteins. They can be need for treatment of cancer and authorizants.
                                                                                                                                          note= "(His)6 histidine tag attached to N-terminal Met"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28

```

gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methicnine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune diseases 28 57 The present sequence is a recombinant Rana pipiens ribonuclease (RaPLR1) protein with Met at position 1. Carboxy terminal end of recombinant RaPLR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic ODWLTFOKKHLINTRDVDCNNIMSTNLF----HCKDKNTFIYSRPEPVKAICKGIIASKN 1 QNWATFQQKHIINT-PIICNTIMDNNIYIVGGQCKRVNTFIISSATTVKAICTGVI-NWN Gaps VLSTTRFQLNTCTRISITPRPCPYSSRTEINYICVKCENQYPVHFAGIGRC 109 6 DB 2; Length 105; Indels 32; Score 281.5; DB 2 Pred. ```

4,

The present sequence is a Rana pipiens clone 5alb ribonuclease (RaPLRI). It is encoded by Clone 5alb cDNA obtained from Rana pipiens liver mRNA library. It exhibits differences with Oncoase (RTM) at amino acid residues 11, 20, 85 and 103. Carboxy terminal end of RaPLRI has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methicnine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonucleases allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune

New recombinant ribonucleases, used for killing target cells, e.g. for treating cancers, viral infections or autoimmune diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δ
                                                                                                                 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a specifically claimed example of an antitumour protein from the generic protein in AAW18224, with the molecular weight 12000. This is one of two preferred proteins (the other in AAW6543) that have been isolated from Rana pipiens occytes. Both proteins have a blocked amino terminal group and are essentially free of carbohydrates. The proteins are used to treat tumours. Use of the peptides has fewer disadvantages than chemotherapy, radiotherapy and surgery in the treatment of tumours

The present sequence is a recombinant Rana catesbelana oocyte ribonuclease (RaCOR1) protein with Met at position 1 attached to a (His)6 tag, Met21Jeu and Met58Leu. Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune Sequence 111 AA;

in immune and autoimmune diseases. Additionally, they may be used as contraceptives. Finally they can also be used for cell separation in vitro by selectively killing unwanted types of cells (e.g. in bone marrow) prior to transplantation into a patient undergoing marrow ablation by radiation or for killing leakemia cells or T-cells that would cause graft-versus-host disease. This sequence represents a bullfrog This invention describes a novel nucleic acid construct comprising sequences encoding functional pancreatic RNase and a second protein (preferably the light and heavy chains of an antibody) which binds a specific cell surface marker on a target cell and functions as a cytotoxic agent. The products can be used for selectively killing cells tumors or infected cells (e.g. cells infected by viruses (sepecially latent or chronic virus infections, such as human immunodeficiency virus (HIV)-1, Epstein-Barr virus, herpes viruses (herpes simplex types I and II), hepatitis viruses (8, non-A-non-B, and delta), herpes zoster, cytomegalovirus)) and cells infected with parasites (such as the malaria parasite)). They can also be used for treating immune dysfunctional cells 2 QNWATFQQKHIINTFIICNTILDNNIYIVGGQCKRVNTFIISSATTVKAICTGVINLNVL 61 heavy chain; cell surface marker; treatment; tumor; viral infection; parasite infection; immune dysfunctional cell; autoimmune disease; contraceptive; cell separation; transplantation; bone marrow ablation; leukemia cell; T-cell; graft-versus-host disease; bullfrog; lectin. nntly fused pancreatic RNase-targeting proteins useful for tumors, infections, immune or autoimmune disorders and as Cytotoxic; RNase; ribonuclease; pancreatic; antibody; light chain; STTRFQLNTCTRISITPRPCPYSSRTETNYICVKCENQYPVHFAGIGRCP 110 STIRFQLNICTRISITERPCPYSSRTEINVICVKCENQYPVHFAGIGRCP 111 Nicholls PJ, Youle RJ; (USSH) US DEPT HEALTH & HUMAN SERVICES. Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety, which can be a LLZ antibody directed against CD22 on cancerous 3 cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a recombinant Rana catesbelana oocyte tribonuclease (RacOR1) protein with Met22Leu Met57Leu. Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or muman chorinoir gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is claved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and

Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and

                                                                                                                                                                                                                                                         Recombinant Rana catesbeiana oocyte ribonuclease; RacOR1 Gln1Ser; CD22; covalently bound; LL2 antibody; ligand binding moiety. cancerous B cell; bullfrog; Kaposi's sarcoma; human chorionic gonadotrophin; hCG; RNase; signal peptide; recombinant ribonuclease; cytotoxic fusion protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a recombinant Rana catesbelana oocyte ribonuclease (RaCOR1) protein with Gln1Ser. Carboxy terminal end of recombinant RaCOR1 has a covalently bound ligand binding moiety, which can be a Li2 antibody directed against CD22 on cancerous B cells or huma chorionic gonadotrophin (hCG) effective against Kaposi's sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an Neterminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form cytotoxic fusion proteins. They can be used for treatment of cancer and autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New recombinant ribonucleases, used for killing target cells, e.g. for treating cancers, viral infections or autoimmune diseases.

New recombinant ribonucleases, used for killing target cells, e.g. for treating cancers, viral infections or autoimmune diseases.

Claim 22; Page 62; 71pp; English.

The present sequence is a Rana catesbeiana oocyte ribonuclease (RacOR1) protein encoded by a cDNA modified for expression in E. coli. Carboxy terminal end of RacOR1 has a covalently bound ligand binding moiety, which can be a LL2 antibody directed against CD22 on cancerous B cells or human chorionic gonadotrophin (hCG) effective against Kaposi's Sarcoma cells. Recombinant ribonucleases can be expressed in bacteria without an N-terminal methionine due to the presence of a signal peptide that is cleaved by bacteria. The soluble expression of ribonuclease allows the proteins to be fused in-frame with ligand binding moieties to form

-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds to actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tENAs.
-!- SUBCELPULAR LOCATION: Secreted.

Biol. Evol. 19:438-445(2002).

-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds to actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular ENRAs (By similarity).
                                                                                                                                                                                                                                                                              Gaps

Biochemistry 35:8870-8880(1996).
Biochemistry 35:8870-8880(1996).
Lo actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endocytosed and translocated to the nucleus, thereby promoting the endochelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and mailgnant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular triNAs. Binds tightly to placental ribonuclease inhibitor and has very low ribonuclease activity.
-: SINGELEGITY: Secreted.
-: SINIARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DVDCNNIMSTNLF--HCKDKNTFIYSRPEPVKAICKGIIASKN------VLTTSEFYL

"Diversifying selection of the tumor-growth promoter angiogenin in primate evolution.";

Mol. Biol. Evol. 19:438-445(2002).

-!- FUNCTION: May function as a tRNA-specific ribonuclease that binds to actin on the surface of endothelial cells; once bound, angiogenin is endocytosed and translocated to the nucleus, thereby promoting the endothelial invasiveness necessary for blood vessel formation. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs (By similarity).

-!- SUBCELIULAR LOCATION: Secreted.

-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                              --- PCKYKLKKS

-!- FWOVTION: The S-lectins in frog eggs may be involved in the fertilization and development of the frog embryo. This lectin preferentially agglutinate a large variety of tumor cells, but it does not agglutinate non-transformed cells and erythrocytes.
-!- SUBGELIULAR LOCATION: Secreted.
-!- SUBCILIULAR LOCATION: Secreted.
-!- STATIARRIY: Belongs to the pancreatic ribonuclease family.
PIR: JX0120: JX0120.

Ribonuclease, liver (EC 3.1.27.5).
Rana catesbelana (Bull frog).
Rukaryota, Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Amphibia: Batrachia; Anura; Neobatrachia; Ranoidea; Rana.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                J. Blochem. 106:729-735(1989).
-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-phosphates and 3'-phosphatoligonucleotides ending in C-P or U-P with 2', 3'-cyclic phosphate intermediates.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBLEMILY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Iguana iguana (Common iguana).

                                                                                                                                                                                                                                MEDIANE=98437383; PubMed=9761686; Chan Y.-C., Chen Y.-C., Hom K., Huang R.-F., Huang T.H.; Chan C., Chen Y.-C., How K., Huang R.-F., Huang T.H.; The solution structure of a cytotoxic ribonuclease from the oocytes of Rana catesbeiana (bullfrog)."; J. Mol. Biol. 283:231-244(1998).

-!-FUNCTION: Preferentially cleaves single-stranded RNA at pyrimidine residues with a 3'flanking guanine. Hydrolyzes poly(U) and poly(C) as substrates, and prefers the former. The S-lectins in frog eggs may be involved in the fertilization and development of the frog embryo. This lectin agglutinates various animal cells, including normal lymphocytes, erythrocytes, and fibroblasts of animal and human origin. It is cytotoxic against several tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SMART; SM0092; RNASE Pc; 1.

Pancreatic ribonuclease (EC 3.1.27.5) - cuis
NyAlternate names: RNase 1; RNase A
C;Species: Galea mustabloides (cuis)
C;Date: 03-Aug-1984 #sequence_revision 03-Aug-1984 #text_change 04-Oct-1996
C;Accession: A00827
R;Beintema, J.J.; Neuteboom, B.
J. Mol. Evol. 19, 145-152, 1983
J;Title: Origin of the duplicated ribonuclease gene in guinea-pig: comparison of the amir A;Reference number: A92957; MUID:87036770; PMID:6571219

; Patent No. 6045793
; GENERAL INFORMATION:
    APPLICANT: Rybak, Susanna M.
    APPLICANT: Rybak, Lluis
    APPLICANT: Nodawer, Alexander
    TITLE OF INVENTION: Recombinant Ribonuclease Proteins
    VUMBER OF SEQUENCES: 64
    CORRESPONDENCE ADDRESS:
    ADDRESSEE: Townsend and Townsend and Crew LLP
APPLICANT: Wlodawer, Alexander
IITLE OF INVENTION: Recombinant Ribonuclease Proteins
NUMBER OF SEQUENCES: 64
                                                                                                                                                                                                                                          CONTON TYPE: P4111-3834
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPOTER: IBM PC compatible
OPERATIONS SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/875,811
FILING DATE: 19-FEB-1998
CLASSTRICATION DATA:
APPLICATION NUMBER: WO PCT/US97/02588
FILING DATE: 19-FEB-1997
PRIOR APPLICATION DATA:

Patent No. 6045793
GENERAL INFORMATION:
APPLICANT: Rybak, Susanna M.
APPLICANT: Newton, Dianne L.
APPLICANT: Modue, Lluis
APPLICANT: Moduer, Alexander
TITLE OF INVENTION: Recombinant Ribonuclease Proteins
                                                                     APPLICANT: Rybak, Susanna M.
APPLICANT: Newton, Dianne L.
APPLICANT: Boque, Lluis
APPLICANT: Wlodawer, Allaxander
TITLE OF INVENTION: Recombinant Ribonuclease Proteins
NUMBER OF SEQUENCES: 64
                                                                                                                                                                                                                                                                                                                                                                                                                 MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PALENTIN Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/875,811
FILING DATE: 19-FEB-1998

-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-
phosphates and 3'-phosphate intermediates.

-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-
phosphates and 3'-phosphate intermediates.

-!- SUBCELLUIAR LOCATION: Secreted.

-!- TISSUE SPECIFICITY: Pancreas.

-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.

PIR: $41111: $41111.

An angiogenic protein from hovine serum and milk -- purification as primary structure of angiogenin-2.",

Eur. J. Biochem. 247:535-544(1997).

-!- FUNCTION: Binds tightly to placental ribonuclease inhibitor and has very low ribonuclease activity. Has potent angiogenic activity. Angiogenin induces vascularization of normal and malignant tissues. Abolishes protein synthesis by specifically hydrolyzing cellular tRNAs.

-!- TISSUE SPECIFICITY: Serum and milk.

-!- SIMILARITY: Belongs to the pancreatic ribonuclease family.
                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryota; Merazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

Biol. Chem. 245:654-661 (1970).
-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to nucleoside 3'-
phosphates and 3'-phosphooligonucleotides ending in C-P or U-P
with 2',3'-cyclic phosphate intermediates.
-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                      Sus scrofa (Pig).
